# Automated Software Analysis Techniques

- Aims to explore possible behaviors of target systems in an exhaustive manner

- Key methods:
  - Represents a target program/or executions as a "logical formula"
  - Then, analyze the logical formula (a target program) by using logic analysis techniques

Weakness of conventional testing →

Symbolic execution (1970)

Model checking (1980)

SW model checking (2000)

Concolic testing (2005 ~)

KAIST

Hierarchy of SW Coverages

Complete Value Coverage — CVC — (SW) Model checking

Complete Path Coverage — CPC — Concolic testing

Prime Path Coverage — PPC

All-DU-Paths Coverage — ADUP

All-uses Coverage — AUC

All-defs Coverage — ADC

Edge-Pair Coverage — EPC

Edge Coverage — EC

Node Coverage — NC

Complete Round Trip Coverage — CRTC

Simple Round Trip Coverage — SRTC

KAIST

Weaknesses of the Branch Coverage

```
/* TC1: x= 1, y= 1;
   TC2: x=-1, y=-1;*/
 void foo(int x, int y) {
   if ( x > 0)
       x++;
   else
       x--;
   if(y >0)
       y++;
   else
       y--;
   assert (x * y >= 0);
}
```

Systematic testing techniques are necessary for quality software!
-> Integration testing is not enough
-> Unit testing with automated test case generation is desirable
    for both productivity and quality

Dynamic v.s. Static Analysis

	Dynamic Analysis (i.e., testing)	Static Analysis (i.e. model checking)
Pros	•Real result •No environmental limitation •Binary library is ok	•Complete analysis result •Fully automatic •Concrete counter example
Cons	•Incomplete analysis result •Test case selection	•Consumed huge memory space •Takes huge time for verification •False alarms

-> Concolic testing

Concolic Approach

- Combine concrete and symbolic execution
  - **Conc**rete + Symb**olic** = Concolic
- In a nutshell, concrete execution over a concrete input guides symbolic execution
  - No false positives
- Automated testing of real-world C Programs
  - Execute target program on automatically generated test inputs
  - All possible execution paths are to be explored
  - Higher branch coverage than random testing
Overview of Concolic Testing Process

1. Select input variables to be handled symbolically
2. A target C program is statically instrumented with probes, which record symbolic path conditions
3. The instrumented C program is executed with given input values
   - Initial input values are assigned randomly
4. Obtain a symbolic path formula φ_i from a concrete execution over a concrete input
5. One branch condition of φ_i is negated to generate a modified symbolic path formula φ_i'
6. A constraint solver solves φ_i' to get next concrete input values
   - Ex. φ_i : (x < 2) && (x + y **>=** 2) and φ_i' : (x < 2) && (x + y **<** 2).
     One solution is x=1 and y=0
7. Repeat step 3 until all feasible execution paths are explored

Itera-tions

KAIST

Concolic Testing Example

```
// Test input a, b, c
void f(int a, int b, int c) {
  if (a == 1) {
    if (b == 2) {
      if (c == 3*a + b) {
        Error();
} } } }
```
- Random testing
  - Probability of reaching Error( ) is extremely low
- Concolic testing generates the following 4 test inputs
  - (0,0,0): initial random input
    - Obtained symbolic path formula (SPF) φ: a!=1
    - A modified SPF φ' generated from φ : !(a!=1)
  - (1,0,0): a solution of φ' (i.e. !(a!=1))
    - SPF φ : a==1 && b!=2
    - A modified SPF φ' : a==1 && !(b!=2)
  - (1,2,0)
    - SPF φ : a==1 && (b==2) && (c!=3*a +b)
    - A modified SPF φ' : a==1 && (b==2) && !(c!=3*a +b)
  - (1,2,5)
    - Covered all paths and Error() reached

a!=1   a==1

(0,0,0)

b!=2   b==2

(1,0,0)

c!=3*a+b   c== 3*a+b

10/42 (1,2,0)   (1,2,5)

Concolic Testing Example'

```
// Test input a, b, c
void f(int a, int b, int c) {
    if (a == 1) {
        if (b == 2) {
            b= b+a;
            if (c == 3*a + b) {
                Error();
} } } }
```

- Random testing
  - Probability of reaching Error( ) is extremely low
- Concolic testing generates the following 4 test inputs
  - (0,0,0): initial random input
    - Obtained symbolic path formula (SPF) φ: a!=1
    - A modified SPF φ' generated from φ : !(a!=1)
  - (1,0,0): a solution of φ' (i.e. !(a!=1))
    - SPF φ : a==1 && b!=2
    - A modified SPF φ' : a==1 && !(b!=2)
  - (1,2,0)
    - φ : a==1 && (b==2) && **b'== b +a** && (c!=3*a +**b'**)
    - φ' : a==1 && (b==2) && **b'== b +a** && !(c!=3*a +**b'**)
  - (1,2,6)
    - Covered all paths and

Error() reached

11/42

Example

```
typedef struct cell {
  int v;
  struct cell *next;
} cell;

int f(int v) {
  return 2*v + 1;
}

int testme(cell *p, int x) {
  if (x > 0)
    if (p != NULL)
      if (f(x) == p->v)
        if (p->next == p)
          Error();
  return 0;
}
```
- Random Test Driver:

  - random memory graph reachable from p

  - random value for x

- Probability of reaching Error( ) is extremely low

Example from the slides "CUTE: A Concolic Unit Testing Engine for C" by K.Sen 2005

Concolic Testing

```
typedef struct cell {
  int v;
  struct cell *next;
} cell;

int f(int v) {
  return 2*v + 1;
}

int testme(cell *p, int x) {
  if (x > 0)
    if (p != NULL)
      if (f(x) == p->v)
        if (p->next == p)
          Error();
  return 0;
}
```

        if (p->next == p)
          Error();
  return 0;
}
```
Summary: Concolic Testing

- Pros
  - Automated test case generation
  - High coverage
  - High applicability (no restriction on target programs)
- Cons
  - If a target program has external binrary function calls, coverage might not be complete
    - Ex. if(sin(x) + query(y) == 0.3) { error(); }
  - Current limitation on pointer and array
  - Slow analysis speed due to a large # of TCs

Concolic Testing Tools

- CROWN
  - Target: C
  - Instrumentation based extraction
  - BV supported
  - https://github.com/swtv-kaist/CROWN
- KLEE (open source)
  - Target: LLVM
  - VM based symbolic formula extraction
  - BV supported
  - Symbolic POSIX library supported
  - http://ccadar.github.io/klee/
- PEX (IntelliTest incorporated in Visual Studio Enterprise)
  - Target: C#
  - VM based symbolic formula extraction
  - BV supported
  - Integrated with Visual Studio
  - http://research.microsoft.com/en-us/projects/pex/
- CATG (open source)
  - Target: Java
  - Trace/log based symbolic formula extraction
  - LIA supported

Case Study: Busybox

- We test a busybox by using CREST.
  - BusyBox is a one-in-all command-line utilities providing a fairly complete programming/debugging environment
  - It combines tiny versions of ~300 UNIX utilities into a single small executable program suite.
  - Among those 300 utilities, we focused to test the following 10 utilities
    - **`grep, vi, cut, expr, od , printf, tr, cp, ls, mv.`**
    - We selected these 10 utilities, because their behavior is easy to understand so that it is clear what variables should be declared as symbolic
    - Each utility generated 40,000 test cases for 4 different search strategies

Busybox Testing Result

Utility	LOC	# of branches	DFS #of covered branch/time	CFG #of covered branch/time	Random #of covered branch/time	Random_input #of covered branch/time	Merge of all 4 strategies #of covered branch/time

Result of grep

Experiment 1:

Iterations: 10, 000

branches in grep.c : 178

Execution Command:

    run_crest './busybox grep "define" test_grep.dat' 10000 -**dfs**

    run_crest './busybox grep "define" test_grep.dat' 10000 -**cfg**

    run_crest './busybox grep "define" test_grep.dat' 10000 -**random**

    run_crest './busybox grep "define" test_grep.dat' 10000 -**random_input**
Strategy	Time cost (s)
Dfs	2758
Cfg	56
Random	85
Pure_random	45

Test Oracles

- In the busybox testing, we do not use any explicit test oracles
  - Test oracle is an orthogonal issue to test case generation
  - However, still violation of runtime conformance (i.e., no segmentation fault, no divide-by-zero, etc) can be checked
- Segmentation fault due to integer overflow detected at busybox grep
  - This bug was detected by test cases generated using DFS
  - The bug causes segmentation fault when
    - -B 1073741824 (i.e. 2^32/4)
    - PATTERN should match line(s) after the 1st line
    - Text file should contain at least two lines
  - Bug scenario
    - Grep tries to dynamically allocate memory for buffering matched lines (-B option).
    - But due to integer overflow (# of line to buffer * sizeof(pointer)), memory is allocated in much less amount
    - Finally grep finally accesses illegal memory area

Bug 2653 - busybox grep with option -B can cause segmentation fault

Status: RESOLVED FIXED
Reported: 2010-10-02 06:35 UTC by Yunho Kim
Modified: 2010-10-03 21:50 UTC (History)

Product: Busybox
Component: Other
Version: 1.17.x
Platform: PC Linux

Yunho Kim   2010-10-02 06:35:09 UTC

I report an integer overflow bug in a busybox grep applet, which causes an memory corruption.

```
**** findutils/grep.c ****
634     if (option_mask32 & OPT_C) {
635         /* -C unsets prev -A and -B, but following -A or -B
636            may override it */
637         if (!(option_mask32 & OPT_A)) /* not overridden */
638             lines_after = Copt;
639         if (!(option_mask32 & OPT_B)) /* not overridden */
640             lines_before = Copt;
```

- Bug patch was immediately made in 1 day, since this bug is critical one
  - Importance: P5 major
    - major loss of function
  - Busybox 1.18.x will have fix for this bug

olution for Huge Economic & Social Cost **due to SW Bugs**

Labor-intensive Manual Testing
Large SW Testing Cost and Time
Low Bug Detection Abilty
Low Product Quality

Solution: AI-based Automated Concolic Testing Technique

Detected SW b the software in security equipr

SAGE: Whitebox Fuzzing for Security Testing @ Microsoft

- X86 binary concolic testing tool to generate millions of test files automatically targeting large applications
  - used daily in Windows, Office, etc.
- Mainly targets crash bugs in various windows file parsers (>hundreds)
- Impact: since 2007 to 2013
  - 500+ machine years
  - 3.4 Billion+ constraints
  - 100s of apps, 100s of bugs
    - 1/3 of all security bugs detected by Win7 WEX team were found by SAGE
  - Millions of dollars saved

This slide quotes PLDI 2013 MSR Open House Event poster "SAGE: WhiteboxFuzzing for Security Testing" by E.Bounimova, P.Godefroid, and D.Molnar

Microsoft Security Risk Detection

- Azure-based cloud service to find security bugs in x86 windows binary

- Based on concolic testing techniques of SAGE

'마이스트' 적용...대화형 검색 로봇 '마이봇'도 도입

(서울=연합뉴스) 윤보람 기자 = 현대모비스[012330]가 인공지능(AI)을 활용해 자율주행, 커넥티비티(연결성) 등 미래 자동차 소프트웨어(SW) 개발에 속도를 낸다.

현대모비스는 AI를 기반으로 하는 소프트웨어 검증시스템 '마이스트'(MAIST: Mobis Artificial Intelligence Software Testing)를 최근 도입했다고 22일 밝혔다.

실제 현대모비스가 통합형 차체제어시스템(IBU)과 써라

MAIST can reduce 53% and 70% of manual testing effort for IBU(Integrated Body Unit) and SVM(Surround View Monitoring)

현대모비스는 하반기부터 소프트웨어가 탑재되는 제동, 조향 등 모든 전장부품으로 마이스트를 확대 적용할 계획이다. 글로벌 소프트웨어 연구기지인 인도연구소에도 적용한다.

■ 현대모비스 인공지능 도입 사례

AI 시스템	목적	도입 효과
마이스트 (MAIST)	소프트웨어 검증 자동화	IBU 53% → SVM 70% → Reduction of manual testing effort
마이봇 (Mobis AI Robot)	소프트웨어 개발문서 검색	딥러닝 기반 ... 건 관리

Hyundai Mobis and a research team lead by Prof. Moonzoo Kim at KAIST jointly developed MAIST for automated testing
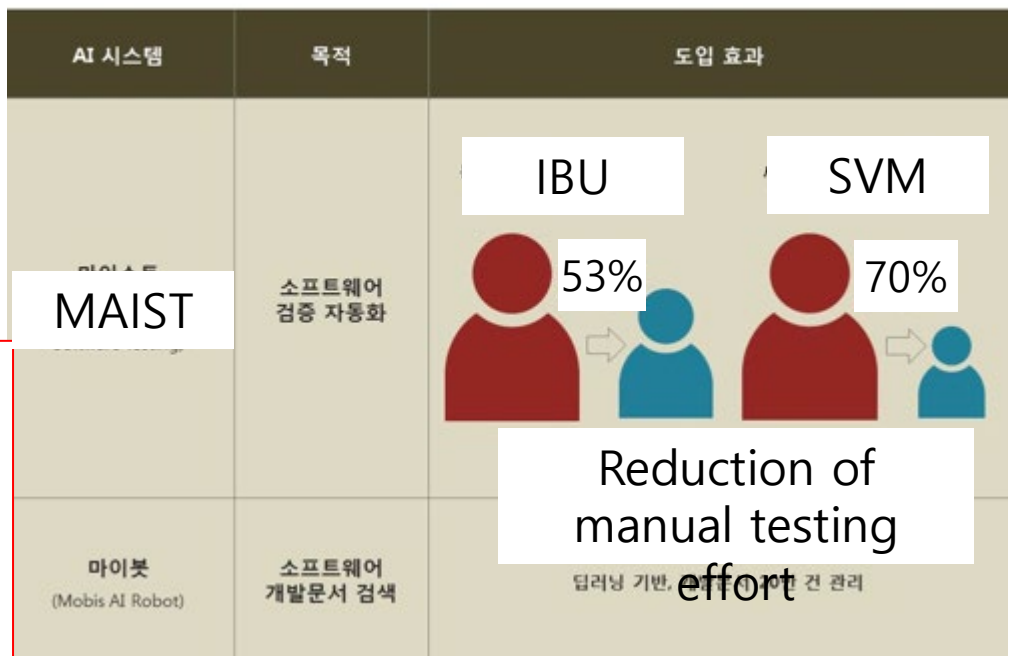

MAIST automates unit coverage testing performed by human engineers by applying concolic unit testing

Model Checking vs Concolic Testing

	Model checking	Concolic testing
Analysis approach	Monolithic (i.e., whole analysis should be completed)	Incremental (i.e., analysis results are accumulated step-by-step) - Anytime algorithm
Compositional analysis	No	Yes (analysis of each symbolic execution path is **independent** from each other)
Accuracy	Very high	Very high (per given assert statements) - Known as path model checker
Explicit test inputs	Not generated	Generated
Requires abstraction	Yes	No
Memory consumption	Very high	Low
CPU time consumption	Very high	Very high
External binary library handling	None	Partial
Debugging support	**Limited (except a counter example generated)**	**Fully supported (you can freely use gdb or printf to analyze each concrete execution)**
Scalability	**Very limited**	**Large**

Various Automated SW Analysis Techniques Have Its Own Pros/Cons and Its Best Uses !!!

https://www.escoffier.edu/blog/culinary-arts/different-knives-and-the-best-uses-for-each/

Future Direction

- Tool support will be strengthened for automated SW analysis
  - Ex. CBMC, BLAST, CREST, KLEE, and Microsoft PEX
  - Automated SW analysis will be performed routinely like GCC
  - Labor-intensive SW analysis => automated SW analysis by few experts
- Supports for concurrency analysis
  - Deadlock/livelock detection
  - Data-race detection
- Less user input, more analysis result and less false alarm
  - Fully automatic C++ syntax & type check (1980s)
  - (semi) automatic null-pointer dereference check (2000s)
  - (semi) automatic user-given assertion check (2020s)
  - (semi) automatic debugging (2030s)

Conclusion

- <u>Automated concolic testing</u> is effective and efficient for testing industrial embedded software including vehicle domain as well as consumer electronics domain

- Successful application of automated testing techniques requires <u>expertise of human engineers</u>

SW Testing Cost

Automated Testing

Manual Testing

25%   50%   75%   100%

SW Reliability
Traditional testing

- Manual TC gen
- Testing main scenarios
- System-level testing
- Small # of TCs

Concolic testing

- Automated TC gen
- Testing exceptional scenarios
- Unit-level testing
- Large # of TCs
